The titration curve in Figure 1 shows a strong acid being titrated by a strong base. There is the initial slow rise in pH until the reaction nears the point where just enough base is added to neutralize all the initial acid. This point is the . equivalence point. Use the graph and reading to answer the questions below on a separate sheet of paper.

An acid - base titration curve can be derived by drawing a relationship between the pH of the titration solution (conical flask solution) on the y- axis and the volume of the titrant (standard solution) which is read from the burette on the x-axis.

The most common titrations are acid-base titrations. These reactions are easily monitored by keeping track of pH changes with a pH meter or by choosing an indicator that changes color when the acid and base have reacted in stoichiometric quantities. This point is referred to as the equivalence point. Look at the fol-

The simplest acid-base reactions are those of a strong acid with a strong base. Table 4 shows data for the titration of a 25.0-mL sample of 0.100 M hydrochloric acid with 0.100 M sodium hydroxide. The values of the pH measured after successive additions of small amounts of NaOH are listed in the first column of this table, and are graphed in Figure 1, in a form that is called a titration curve.

The equivalence point of an acid-base titration is the point at which exactly enough acid or base has been added to react completely with the other component. The equivalence point in the titration of a strong acid or a strong base occurs at pH 7.0. In titrations of weak acids or weak bases, however, the pH at the equivalence point is greater ...
