Introduction to Uniform Circular Motion and Gravitation. Many motions, such as the arc of a bird's flight or Earth's path around the Sun, are curved. Recall that Newton's first law tells us that motion is along a straight line at constant speed unless there is a net external force. We will therefore study not only motion along curves, but also the forces that cause it, including gravitational forces.

Contributors; This chapter deals with the simplest form of curved motion, uniform circular motion, motion in a circular path at constant speed. Studying this topic illustrates most concepts associated with rotational motion and leads to the study of many new topics we group under the name rotation. Pure rotational motion occurs when points in an object move in circular paths centered on one point.

Topic 6: Circular motion and gravitation. See the guide for this topic. 6.1 – Circular motion. Period, frequency, angular displacement and angular velocity. Uniform circular motion refers to circular motion at constant speed. In a uniform circular motion, speed is constant while (angular) velocity and (angular) acceleration are constantly changing. While the magnitude of its velocity remains constant, the direction of its velocity is constantly changing.

6 Uniform Circular Motion and Newton's Law of Gravitation. INTRODUCTION. In Chapter 2, we considered two types of motion: straight-line motion and parabolic motion. We will now look at motion that follows a circular path, such as a rock on the end of a string, a horse on a merry-go-round, and (to a good approximation) the Moon around Earth and Earth around the Sun. " The tangential speed (v_t) of an object in circular motion is the object's speed along an imaginary line drawn tangent to the circular path. " Tangential speed depends on the distance from the object to the center of the circular path. " When the tangential speed is constant, the motion is described as uniform circular motion.
