where  $n_1$  is the index of refraction of the incident medium,  $\theta_1$  is the angle of incidence,  $n_2$  is the index of refraction of the refractive medium, and  $\theta_2$  is the angle of refraction. Re-write the equation to solve for  $n_2$ , and you get:  $n_2 = n_1 [\sin(\theta_1)/\sin(\theta_2)]$

relationship called Snell's law The index of refraction, given by the letter  $n$ , is defined as the ratio of the speed of light in a vacuum to the speed of light in a medium:  $n = \frac{c}{v}$  -where  $c = 3 \times 10^8$  m/s.

and refraction of a ray of light as it attempts to move from one medium to another.

Use the sliders to adjust the index of refraction of each of the two materials, as well as the angle of incidence (the angle between the incident ray of light and the normal to the surface).

## **Physics Simulations at The Physics Classroom**

The index of refraction shows how much faster light propagates in a vacuum than in that material:  $n = \frac{c}{v}$  Where 'c' is the speed of light in a vacuum and 'v' is the speed of light in the material. Since light has the maximum speed in vacuum, the index of refraction for

# Read PDF Laboratory Simulation Refraction

any material is always greater than 1.
